

Online Supplemental Information

Understanding the genetic diversity of Picobirnavirus: a classification update based on phylogenetic and pairwise sequence comparison approaches.

Lester J. Perez, Michael G. Berg, Gavin A. Cloherty
Infectious Diseases Research, Abbott Diagnostics, Abbott Park IL

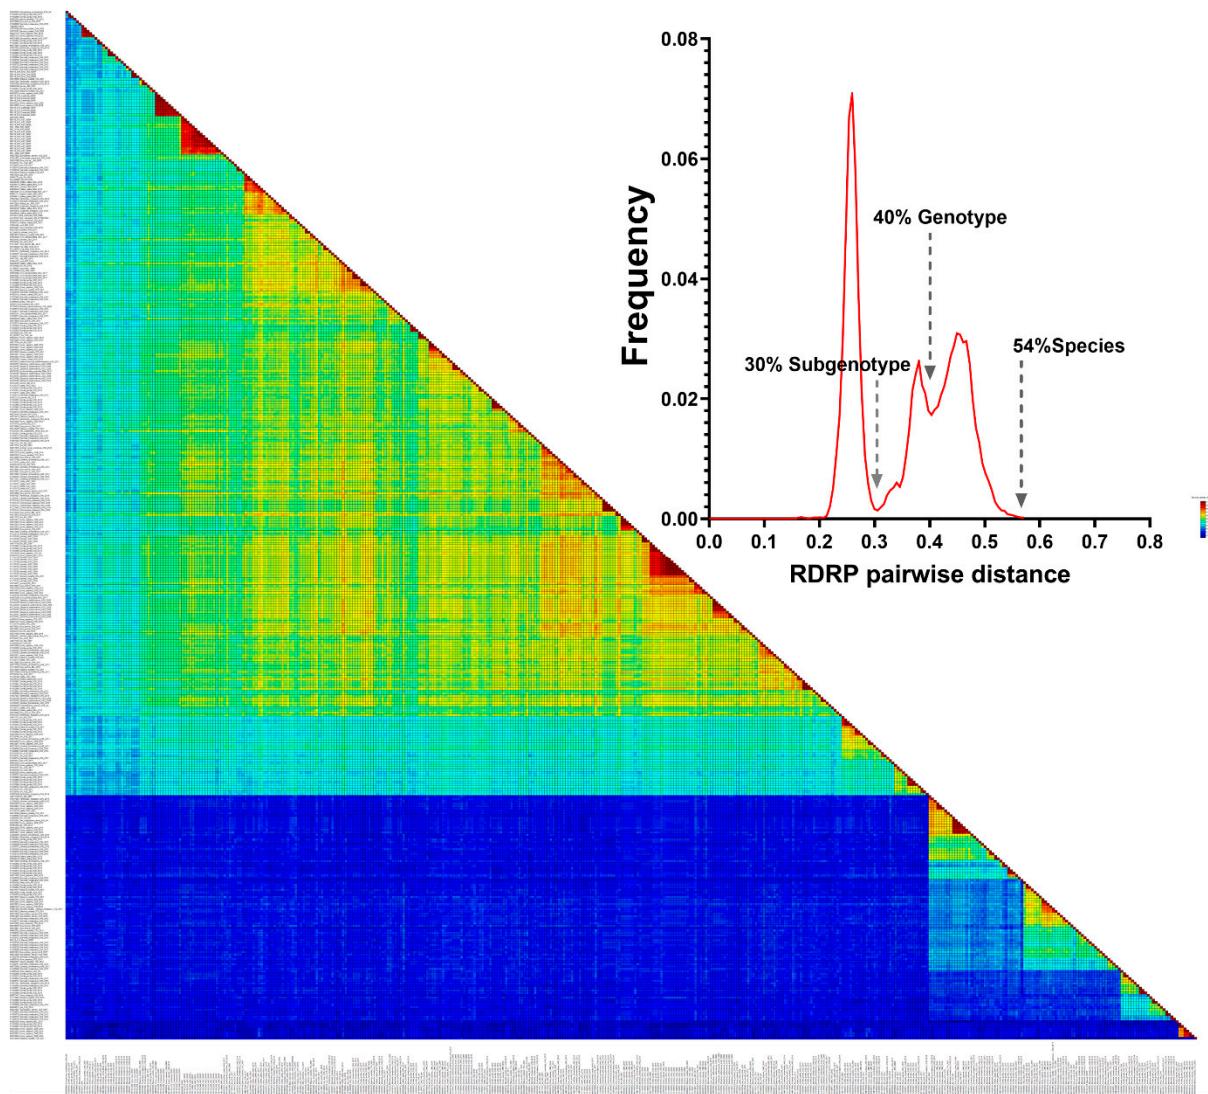

Figure S1. Frequency distribution of pairwise distance and clustering pattern for all lineages of PBV for RdRp. Results obtained from SDT represented by a color-coded pairwise identity matrix generated from the 403 RdRp complete coding sequences of PBV included in the current study. Each colored cell represents a percentage of identity score between two sequences (one indicated horizontally to the left and the other vertically at the bottom). A colored key indicates the correspondence between pairwise identities and the colors displayed in the matrix. Pairwise identity frequency distribution plot is also shown. The horizontal axis indicates percentage pairwise distance. The cut-off values for sub-genotype, genotype and species were also denoted.

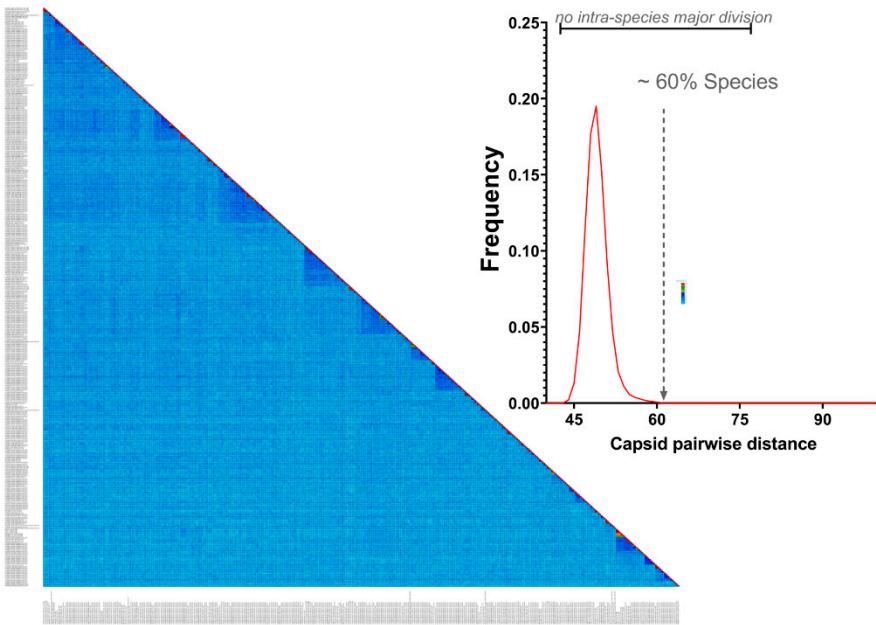

Figure S2. Frequency distribution of pairwise distance and clustering pattern for all lineages of PBV for capsid. Results obtained from SDT represented by a color-coded pairwise identity matrix generated from the 422 complete capsid coding sequences of PBV included in the current study. Each colored cell represents a percentage of identity score between two sequences (one indicated horizontally to the left and the other vertically at the bottom). A colored key indicates the correspondence between pairwise identities and the colors displayed in the matrix. Pairwise identity frequency distribution plot is also shown. The horizontal axis indicates percentage pairwise distance. The lack of intra-species division and the cut-off value for species demarcation are denoted.

Supplemental Table S1. Listing of GenBank RDRP references.

Table S3. Genetic distances based on complete RDRP coding sequences of all the lineages assessed within the PBV species 1. Values above the diagonal represent the standard error, values below the diagonal represent the p-distance values obtained using MEGAX and 1000 bootstrap replicates. Values shadowed in gray are below the cut-off determined to establish different genotypes (see Figure 5A), thus five genotypes for PBV1 are defined after regrouping and recalculating the distances (see Figure 5A).

Table S5. Genetic distances based on complete RDRP coding sequences of all the lineages assessed within the PBV species 3. Values above the diagonal represent the standard error, values below the diagonal represent the p-distance values obtained using MEGAX and 1000 bootstrap replicates. Values shadowed in gray are below the cut-off determined to establish different genotypes (see Figure 5C), thus three genotypes for PBV3 are defined after regrouping and recalculating the distances.

Gen	3.1	3.2	3.3	3.4	3.5	3.6
3.1		0.0215	0.0253	0.0258	0.0258	0.0240
3.2	0.3103		0.0248	0.0249	0.0245	0.0232
3.3	0.4216	0.4290		0.0231	0.0253	0.0257
