<sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded on Bruker AVANCE III instruments (operating frequency 500.13 and 125.78 MHz) in CDCl<sub>3</sub>, internal standard is the residual solvent signal, subscripts “alpha” and “beta” denote nonequivalent protons at one carbon atom. To refine the multiplicity in the proton spectra analysis, we used the multiplication by the TRAF function. For some weakly intense <sup>13</sup>C spectra, the Convolution difference was used to increase the signal-to-noise ratio.
